

Assignment 4 - Introduction to SQL

Turn in requirements:

- Submit a SQL file (.sql) to webcampus. Please save it as <last_name><first_name>_A4.sql
- Your SQL file should solve the following:

Part 1: Creating the database

Write the SQL code to create a database named <last_name><first_name>

Ex: Choi_Vince

If the database already exists please include the code to DROP it.

Part 2: Creating the tables

Consider the following relational database:

lives (person_id, person_name, street, city)

works (person_id, person_name, company_id, company_name, salary)

located_in (company_name, city)

manages (person_name, manager_name)

Write on the same SQL file the code to create those tables with the same schema.

Notes:

- Names you can assume are of type VARCHAR(50)
- Numerical data will be of type INT
- IDs can be of size SMALLINT

When creating these tables, you should consider constraints that might be useful to include. While you do not need to account for all the possible constraints, do your best to implement a few of them, especially if they are obvious.

Ex: name of person should not be empty

Ex2: IDs should be unique

Include the Primary Keys for each table. As a challenge you can think about additional keys or foreign keys to add.

Part 3: Populating the tables

Write the code to add the following table entries into your database.

lives (person_id, person_name, street, city)

person_id	person_name	street	city
0001	George Washington	13th	New York City
0002	John Adams	Decatur	Las Vegas
0003	Thomas Jefferson	Gillespie	Seattle

works (person_id, person_name, company_id, company_name, salary)

person_id	person_name	company_id	company_name	salary
0001	George Washington	0001	Tree Corp	54000
0002	John Adams	0002	Fountain Pens	40000
0003	Thomas Jefferson	0002	Fountain Pens	43000

located_in (company_name, city)

company_name	city
Tree Corp	New York City
Fountain Pens	New Orleans
Urns R Us	Las Vegas

manages (person_name, manager_name)

person_name	manager_name
John Adams	Thomas Jefferson
